

Business Continuity, Disaster Recovery, Vulnerability Identification, and Risk Assessment

The ability to maintain business continuity without a detrimental effect to operations is an ongoing concern for small and large organizations. Changes resulting from technological introductions, corporate consolidations, human resource upheavals, infrastructure limitations, and communications shortcomings are issues that challenge the ability to sustain business continuity. Our program focuses on preventing issues from escalating to the implementation of emergency procedures. We employ our Success Equation, a four-step process, to develop a plan that provides Business Self-Reliance. Our program is not emergency action planning. We concentrate on developing a Living Business Continuity Plan that addresses future challenges, provides the knowledge and skills for innovative changes to the plan, and permits auditing and continuous improvement monitoring.
