

Cyber Asset Security and Mission Critical Facilities and Processes

We provide significant experience and expertise in performing unbiased and objective business and process reliability evaluations and assessments for cyber asset security, data centers, mission critical facilities & processes, and telecommunications networks. Our studies focus on identifying and comparing technology processes and business processes that are vulnerable to external threat/sabotage or a single failure issue which may result in business impacting interruptions. These studies are comprised of technical evaluations that review operations, facility infrastructure, staffing, and operating processes and which lead to updating and/or enhancing procedures, guidelines, and policies that will ensure the proper operation of equipment and processes under all operating environments.
